BUILD · PREVIEW · SHIP

Vibe to production.

Planned · built · *shipped*

Engineering-grade vibe coding for construction IT — board & finance
briefing · 2026

The problem

- **Flood of “vibe” builders** — most are horizontal chat-to-app toys or thin wrappers; few survive enterprise security, deployment, or lifecycle scrutiny.
- **Workflow-first ≠ product factory** — orchestrators (including agent workflow platforms) optimize steps across tools; they do not hand IT **owned, branded applications** customers run as first-class software.
- **Not AEC-centered** — generic stacks ignore systems of record (Procore; Autodesk ACC / BIM 360-class); field realities; and IT operating models — “vertical AI” often stops at demos.
- **Wrong buyer focus** — many competitors court individual makers; **AEC IT** needs governance, tenancy, and deploy-under-your-cloud — or the deal never clears procurement.

What nVibe is

- • **AEC-native agents & integrations** — roadmap agents toward APIs and semantics buyers already pay for (Procore; Autodesk Construction Cloud / Forge-class paths). Third-party names are integration targets — no implied endorsement.
- • **IT-owned delivery** — generation power for **IT & innovation teams**, with paths to deploy under customer clouds and IdP estates peers rarely optimize for.
- • **Company-branded apps** — tenants ship experiences under their brand; not a generic vendor workflow canvas.
- • **Git-native output** — generated code can live in **customer repositories** for security review before production.
- • **Deploy anywhere** — customer cloud or edge where policy requires; no mandatory lock-in to a single SaaS landlord.
- • **Full-stack apps** — Node/Vue applications with audit trails customers can run like any other engineering asset — beyond simple workflow builders.

Competitive landscape

Platform	What it is	AEC depth	IT-owned apps	Workflow-first
nVibe	Engineering-grade app builder for AEC IT; branded tenant apps + agents	Native target: Procore, Autodesk ACC / Forge-class paths	Yes – ship under customer cloud / brand	Not the wedge
Viktor.ai	Python-centric cloud SDK for engineering calculations & parametric UX	Engineering vertical niche; different full-product UX model	Limited vs full branded product factory	Partial
Stack.ai stack-ai.com	Enterprise AI agents & workflow builder – orchestrate LLMs, docs, and tools (no-code pipelines)	Horizontal – back-office & ops automation	Governance / VPC options; not AEC co-branded app line	Yes
VibeWork	Workflow orchestration for enterprise tasks	Not an AEC-first app factory	Tenant deploy story exists; not IT product factory	Yes
Synera synera.io	Agentic AI for product engineering – 75+ CAx/PLM integrations (public site); OEM / manufacturing focus	Manufacturing / PLM-heavy; not an AEC-first IT channel	Orchestration & engineering ops	Yes

Row links go to each vendor's public homepage – validate positioning before external use. Synera (synera.io) is the named workflow/agent peer; nVibe targets AEC IT-

owned branded apps. Directional labels for board discussion.

Who is building nVibe

nCircle + Dan Stephenson — nCircle brings channel, AEC credibility, and governance; Dan leads product and engineering for this phase with an embedded builder from Lexis Solutions.

DS

Dan Stephenson

~20 years shipping production software; ~8 years in construction technology. Founded Flypaper Technologies; now building nVibe. Same delivery bench behind ThoughtPivot — including Barton Malow—scale AI platform work and the vibe-coding stack — applied here under an nCircle-led partnership.

LX

Lexis Solutions

One engineer (L-E-X-I-S) embedded for velocity and field feedback — modeled at ~\$5K/mo inside the year-one envelope alongside lead delivery.

</>

Stack discipline

Core server and tooling on **Node.js** — patterns refined over ~10 years in AEC, not a science experiment on construction IT for the first time.

Go-to-market: first 90 days → year one

PHASE DURATION · MONTHS (ILLUSTRATIVE)

Months 1-2

Concept partners with
nCircle: joint demos, pilot
workflows, align on first
production cut-in.

~Month 3

Early adopter / pilot in
production – feedback loop
on agents, integrations, and
enterprise readiness.

Month 3 → year 1

Harden Procore / Autodesk-
facing agents, repeat GTM
with nCircle's channel,
expand reference footprint
before renewal talks.

Year-one ask & economics

- Lead product & delivery (~\$10K/mo)
- Lexis Solutions engineer (~\$5K/mo)
- Cloud, inference & GTM balance

Illustrative use of funds within a \$250K year-one envelope — final allocation subject to finance and legal.

Commercial intent (directional)

- **\$250K** first-year allocation from nCircle toward delivery, go-to-market, and platform (cloud, inference, tooling).
- **Revenue share: 5% of net revenue** — accrues from **first dollar**, no waiting period (exact waterfall subject to definitive agreements).
- **Commitment:** either party may exit in **months 1-3**; after that, a mutual **12-month** lock-in, then renew or renegotiate.
- **Modeled delivery load** within the envelope: **~\$10K/mo** to lead builder **Dan Stephenson** and **~\$5K/mo** for one embedded **Lexis Solutions** engineer (**~\$15K/mo** combined toward delivery — alternate direct Lexis arrangements possible subject to sign-off). Remaining funds: AWS/GCP, model inference, co-sell, and buffer.

All figures and structures above are directional — subject to final legal and finance approval and alignment with meeting notes and definitive documents.
